  Methods inherited from class java.lang. Object
  equals, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

    Method Details

     equal
       public PegSolitaireGame.grid type[][] equal(PegSolitaireGame.grid type[][] obj, String board type)
       Parameters:
            obj -
            board_type - : type of the board for indication as a string such as "board1"
            returns the grid type which is cloned
     check_left
       public int check left(PegSolitaireGame.grid type[][] board, int i, int j, int N1, int N2)
       Specified by:
            check left in interface PegSolitaireGame
       Parameters:
            board - : grid that will be controlled for legal left move
            i -: row number
            j -: col number
            N1 - i dimension of the grid
            N2 - j dimension of the grid
       Returns:
            1 if the given values on the given grid has a legal move for left direction
     check_right
       public int check right(PegSolitaireGame.grid type[][] board, int i, int j, int N1, int N2)
       Specified by:
            check right in interface PegSolitaireGame
       Parameters:
            board - : grid that will be controlled for legal right move
            i -: row number
            j -: col number
            N1 - i dimension of the grid
            N2 - j dimension of the grid
       Returns:
```

1 if the given values on the given grid has a legal move for right direction

board - grid type

Returns:

first_row - row number of the first touched button first col - col number of the first touched button sec row - row number of the second touched button sec col - col number of the second touched button

1 if the given values on the given grid has a legal move for left direction

```
    load file

  public PegSolitaireGame.grid type[][] load file(String filename)
  Specified by:
       load_file in interface PegSolitaireGame
  Parameters:
       filename - name of the file
  Returns:
       returns the grid on the file
check up
  public int check up(PegSolitaireGame.grid type[][] board, int i, int j, int N1, int N2)
  Specified by:
       check_up in interface PegSolitaireGame

    check down

  public int check down(PegSolitaireGame.grid type[][] board, int i, int j, int N1, int N2)
  Specified by:
       check down in interface PegSolitaireGame
  Parameters:
       board - : grid that will be controlled for legal down move
       i -: row number
       j -: col number
       N1 - i dimension of the grid
       N2 - j dimension of the grid
  Returns:
       1 if the given values on the given grid has a legal move for down direction

    check up manuel

  public int check up manuel(PegSolitaireGame.grid type[][] board, int first row, int first col, int sec row,
  int sec col)
  Parameters:
       board - grid type
       first_row - row number of the first touched button
       first_col - col number of the first touched button
       sec row - row number of the second touched button
       sec_col - col number of the second touched button
  Returns:
       1 if the given values on the given grid has a legal move for up direction

    check down manuel

  public int check down manuel(PegSolitaireGame.grid type[][] board, int first row, int first col, int sec row,
  int sec col)
  Parameters:
       board - grid type
       first row - row number of the first touched button
       first_col - col number of the first touched button
       sec row - row number of the second touched button
       sec col - col number of the second touched button
  Returns:
       1 if the given values on the given grid has a legal move for down direction

    check left manuel

  public int check left manuel(PegSolitaireGame.grid type[][] board, int first row, int first col, int sec row,
  int sec col)
  Parameters:
```

· check right manuel

public int check_right_manuel(PegSolitaireGame.grid_type[][] board, int first_row, int first_col, int sec_row, int sec_col)

Parameters:

board - grid type

first row - row number of the first touched button

first col - col number of the first touched button

sec row - row number of the second touched button

sec_col - col number of the second touched button

Returns:

1 if the given values on the given grid has a legal move for right direction

check_game_is_done

public int check game is done(PegSolitaireGame.grid type[][] board, int N1, int N2)

Specified by:

check game is done in interface PegSolitaireGame

Parameters:

board - grid type

N1 - row dimension of the grid

N2 - col dimension of the grid

Returns:

1 if the game is done else returns 0

initial choose function

public void initial choose function()

function prepares the user interface initially when the program starts

manage_game

public PegSolitaireGame.grid_type[][] board1_temp, int N1, int N2, String board_type, int z)

Specified by:

manage game in interface PegSolitaireGame

Parameters:

board1_temp -: static board type.

N1 -: row parameter for board

N2 - : col parameter for board

board_type - : type of the board as a string such as "board1" for indication

z -: initial parameter to understand if the game is just started or not

Returns:

manages the game, makes the moves, creates the GridLayout, buttons inside it has action listeners to make the moves that user selected

calculateScore

public int calculateScore(PegSolitaireGame.grid type[][] board)

Specified by:

calculateScore in interface PegSolitaireGame

Parameters:

board - board type, it's number of peg's left will be calculated inside the function

Returns:

the number of peg left in the game

computer_game

public void computer_game(PegSolitaireGame.grid_type[][] board, int N1, int N2, String board_type)

Specified by:

computer_game in interface PegSolitaireGame

Parameters:

board - board type

N1 -: row dimension of the board

N2 -: col dimension of the board

board_type - type of the board as string Manages the computer game. Makes the moves until end and finally shows the final board to screen.

computer_game1

public void computer_game1(PegSolitaireGame.grid_type[][] board, int N1, int N2, String board_type)

Parameters:

board - board type

N1 - : row dimension of the board N2 - : col dimension of the board

board_type - type of the board as string Manages the computer game but if it is loaded from file. Makes the moves until end and finally shows the final board to screen.
